

# DSS: Lecture 2

(EBC 2088)

**János Flesch**

*Department of Quantitative Economics  
Maastricht University, The Netherlands*

April 23, 2019

## GENERAL REMARKS:

- Size of a typical database:
  - Entries: between 100-200
  - Questions: between 15-20
- The schedule of the group meetings

## VBA SECURITY: Excel 2010 or 2007

File → Options → Trust Center → Trust Center Settings

→ Macro Settings, and then:

- normally: “Disable all macros with notification” and “Trust access to the VBA project object model”
- when complete and want to run: “Enable all macros” and “Trust access to the VBA project object model”

## THE VBA EDITOR:

- Menu “Developer” in Excel:

File → Options → Customize Ribbon → add “Developer”

- Shortcut to editor: ALT + F11

## SAVING THE VB FILE:

In a macro enabled file type, normally with extension “**xlsm**” .  
For example, “myDSS.xlsm” .

Remark: older versions of Excel use other extensions.

## THE “PROJECT EXPLORER”:

- Excel objects
- Userforms – main part of programming
- Modules

## USERFORMS:

## USERFORMS:

- inserting a new userform

## USERFORMS:

- inserting a new userform
- properties specified in the “properties window”

## USERFORMS:

- inserting a new userform
- properties specified in the “properties window”
- for instance, changing caption (or even name)

## USERFORMS:

- inserting a new userform
- properties specified in the “properties window”
- for instance, changing caption (or even name)
- the **toolbox window**

## LABEL: TO INSERT TEXT ON A USERFORM

Available through the toolbox window.

You need to use SHIFT + ENTER for new line.

COMMANDBUTTON: TO EXECUTE COMMANDS AFTER A CLICK

## COMMANDBUTTON: TO EXECUTE COMMANDS AFTER A CLICK

- inserting a CommandButton

## COMMANDBUTTON: TO EXECUTE COMMANDS AFTER A CLICK

- inserting a CommandButton
- changing caption to “Next”

## COMMANDBUTTON: TO EXECUTE COMMANDS AFTER A CLICK

- inserting a CommandButton
- changing caption to “Next”
- code of the CommandButton after double click:

Code: (now empty)

```
Private Sub CommandButton1_Click()
```

```
End Sub
```

## SWITCHING BETWEEN TWO USERFORMS:

## SWITCHING BETWEEN TWO USERFORMS:

### Code for CommandButton in UserForm1:

Code:

```
Private Sub CommandButton1_Click()  
    UserForm1.Hide  
    UserForm2.Show  
End Sub
```

### Code for CommandButton in UserForm2:

Code:

```
Private Sub CommandButton1_Click()  
    UserForm2.Hide  
    UserForm1.Show  
End Sub
```

Try to run it from UserForm1 (F5).

## DISPLAYING MESSAGES:

## DISPLAYING MESSAGES:

Creating a “Hello” button on UserForm1:

Code:

```
Private Sub CommandButton2_Click()  
    MsgBox( "Hello world !" )  
End Sub
```

# INPUTBOX:

## INPUTBOX:

- Asking for a name:

Code:

```
Private Sub CommandButton2_Click()  
    InputBox("Please type your name")  
End Sub
```

## INPUTBOX:

- Asking for a name:

Code:

```
Private Sub CommandButton2_Click()  
    InputBox("Please type your name")  
End Sub
```

- Using a name:

Code:

```
Private Sub CommandButton2_Click()  
    inputname = InputBox("Please type your name")  
    MsgBox("Hello " & inputname)  
End Sub
```

## INPUTBox:

- Storing a name:

### Code:

```
Private Sub CommandButton2_Click()  
    inputname = InputBox("Please type your name")  
    MsgBox("Hello " & inputname)  
    Sheets("UserData").Select  
    Range("B2").Select  
    ActiveCell.Value = inputname  
End Sub
```

## TEXTBOX: TO RETREAVE INFO FROM THE USER

### Storing text:

#### Code:

```
Private Sub TextBox1_Change()  
    inputtext = TextBox1.Value  
    Sheets("UserData").Select  
    Range("B3").Select  
    ActiveCell.Value = inputtext  
End Sub
```

#### Alternative code:

```
Private Sub TextBox1_Change()  
    inputtext = TextBox1.Value  
    Range("Userdata!B3").Value = inputtext  
End Sub
```

## IF-STATEMENTS:

### Structure:

```
If condition1 Then
    actions1
Elseif condition2 Then
    actions2
...
Else
    actionsElse
End If
```

- actions1 is executed if condition1 holds
- actions2 is executed if condition1 does not hold but condition2 does
- ...
- actionsElse is executed if none of the conditions holds

## IF-STATEMENT EXAMPLE:

### Code:

```
Private Sub CommandButton2_Click()  
    UserName = Range("UserData!B2").Value  
    If UserName = "John Doe" Then  
        MsgBox ("You entered 'John Doe'")  
    ElseIf UserName <> "" Then  
        MsgBox ("Welcome, " & UserName)  
    Else  
        MsgBox ("You didn't enter your name")  
    End If  
End Sub
```

## WHILE-LOOPS:

Structure:

```
While condition  
    actions
```

```
Wend
```

It executes **actions** as long as **condition** holds.

Note: if **condition** does not hold in the beginning, then **actions** are not executed at all.

## WHILE-LOOP EXAMPLE:

### Code:

```
Private Sub CommandButton3_Click()  
    Sheets("UserData").Select  
    i = 1  
    While i <= 10  
        Range("D" & i).Value = i * 2  
        i = i + 1  
    Wend  
End Sub
```

## FOR-LOOPS:

### Structure:

```
For counter = start To end Step step  
    actions  
Next
```

Step 1. Sets **counter** equal to **start**, and executes **actions**.

Step 2. Increases **counter** with **step**.

- If **counter** is at most **end**: executes **actions**, and repeats step 2.
- Otherwise, stops.

Note: **actions** executed at least ones. Also, if **step** equals 1, then it can be omitted.

## FOR-LOOP EXAMPLE:

### Code:

```
Private Sub CommandButton3_Click()  
    Sheets("UserData").Select  
    For i = 1 To 10  
        Range("E" & i).Value = i * 2  
    Next  
End Sub
```

### Equivalent code:

```
Private Sub CommandButton3_Click()  
    Sheets("UserData").Select  
    For i = 2 To 20 Step 2  
        Range("E" & i / 2).Value = i  
    Next  
End Sub
```

## CHECKBOX: CAN BE CLICKED ON OR OFF

- Value of checkbox: on → TRUE, off → FALSE
- Adding three checkboxes to UserForm1
- Making sure that at least one is selected:

### Code:

```
Private Sub CommandButton1_Click()  
    If CheckBox1.Value + CheckBox2.Value + CheckBox3.Value = 0 Then  
        MsgBox ("Please select at least one option")  
    Else  
        UserForm1.Hide  
        UserForm2.Show  
    End If  
End Sub
```

Note: FALSE = 0, TRUE = -1.

### Equivalent code:

```
Private Sub CommandButton1_Click()  
    If (CheckBox1.Value = False And CheckBox2.Value = False  
        no line break And CheckBox3.Value = False) Then  
        MsgBox ("Please select at least one option")  
    Else  
        UserForm1.Hide  
        UserForm2.Show  
    End If  
End Sub
```

## CHECKBOX:

Making sure that at most two are selected:

### Code:

```
Private Sub CommandButton1_Click()  
    If CheckBox1.Value + CheckBox2.Value + CheckBox3.Value = -3 Then  
        MsgBox ("Please select at most two options")  
    Else  
        UserForm1.Hide  
        UserForm2.Show  
    End If  
End Sub
```

## CHECKBOX:

Storing the value of the CheckBox (TRUE or FALSE):

### Code:

```
Private Sub CheckBox1_Click()  
    Sheets("UserData").Select  
    Range("C2").Select  
    ActiveCell.Value = CheckBox1.Value  
End Sub
```

## CHECKBOX:

Storing special values:

### Code:

```
Private Sub CheckBox1_Click()  
    Sheets("UserData").Select  
    Range("C2").Select  
    If CheckBox1.Value = True Then  
        ActiveCell.Value = "Yes"  
    Else  
        ActiveCell.Value = "No"  
    End If  
End Sub
```

TOGGLEBUTTON: SAME AS CHECKBOX, LOOKS DIFFERENT

- can be clicked on or off
- its value is TRUE or FALSE

## OPTIONBUTTONS: RELATED TO CHECKBOXES

Difference: at most one optionbutton can be clicked “TRUE” per **frame** (not per userform).

## EVENT PROCEDURES:

These are code procedures associated with an event.

In the code window:

- upper-left corner: select the **name of control**
- upper-right corner: select the **action of control**

To perform a specific task, you can use a procedure. Two types:

**FUNCTIONS:** procedures that returns a value

**SUBS:** procedures that do not return a value

## FUNCTIONS: PROCEDURES THAT RETURN A VALUE

- They are stored in **Module**.
- They can be called from any sub procedure or another function.

Example of calculating the square root:

Function code:

```
Public Function CalculateSquareRoot(number)  
    CalculateSquareRoot = Sqr(number)  
End Function
```

If the user is asked to enter a number, you have to verify the input before using this function.

The following code for a CommandButton yields a **run-time error** if the user enters -2:

Code:

```
Private Sub CommandButton1_Click()  
    myvar = InputBox("Please enter a positive number")  
    MsgBox ("The square root is " & CalculateSquareRoot(myvar))  
End Sub
```

The following code verifies the input of the user:

Code:

```
Private Sub CommandButton1_Click()  
    myvar = InputBox("Please enter a positive number")  
    If (IsNumeric(myvar) And myvar > 0) Then  
        MsgBox ("The square root is " & CalculateSquareRoot(myvar))  
    Else  
        MsgBox ("Wrong input!")  
    End If  
End Sub
```

For subs: Have a look at “subs.xlsm”.
